Pathogens Damage Tissues

Pathogenic mechanism	Direct mechanisms of tissue damage by pathogens			Indirect mechanisms of tissue damage by pathogens		
	Exotoxin production	Endotoxin	Direct cytopathic effect	Immune complexes	Anti-host antibody	Cell-mediated immunity
						
Infectious agent	<i>Streptococcus pyogenes</i> <i>Haemophilus influenzae</i> <i>Staphylococcus aureus</i> <i>Corynebacterium diphtheriae</i> <i>Clostridium tetani</i> <i>Vibrio cholerae</i>	<i>Escherichia coli</i> <i>Salmonella enterica</i> ssp. <i>typhi</i> <i>Shigella</i> <i>Pseudomonas aeruginosa</i> <i>Yersinia pestis</i>	Variola Varicella-zoster Hepatitis B virus Polio virus Measles virus Influenza virus Herpes simplex virus Human herpes virus 8 (HHV8)	Hepatitis B virus <i>Plasmodium</i> <i>Streptococcus pyogenes</i> <i>Treponema pallidum</i> Most acute infections	<i>Streptococcus pyogenes</i> <i>Mycoplasma pneumoniae</i>	Lymphocytic choriomeningitis virus Herpes simplex virus <i>Mycobacterium tuberculosis</i> <i>Mycobacterium leprae</i> <i>Borrelia burgdorferi</i> <i>Schistosoma mansoni</i>
Disease	Tonsilitis, scarlet fever Boils, toxic shock syndrome, food poisoning Diphtheria Tetanus Cholera	Gram-negative sepsis Meningitis, pneumonia Typhoid fever Bacillary dysentery Wound infection Plague	Smallpox Chickenpox, shingles Hepatitis Poliomylitis Measles, subacute sclerosing panencephalitis Influenza Cold sores Kaposi's sarcoma	Kidney disease Vascular deposits Glomerulonephritis Kidney damage in secondary syphilis Transient renal deposits	Rheumatic fever Hemolytic anemia	Aseptic meningitis Herpes stromal keratitis Tuberculosis Tuberculoid leprosy Lyme arthritis Schistosomiasis

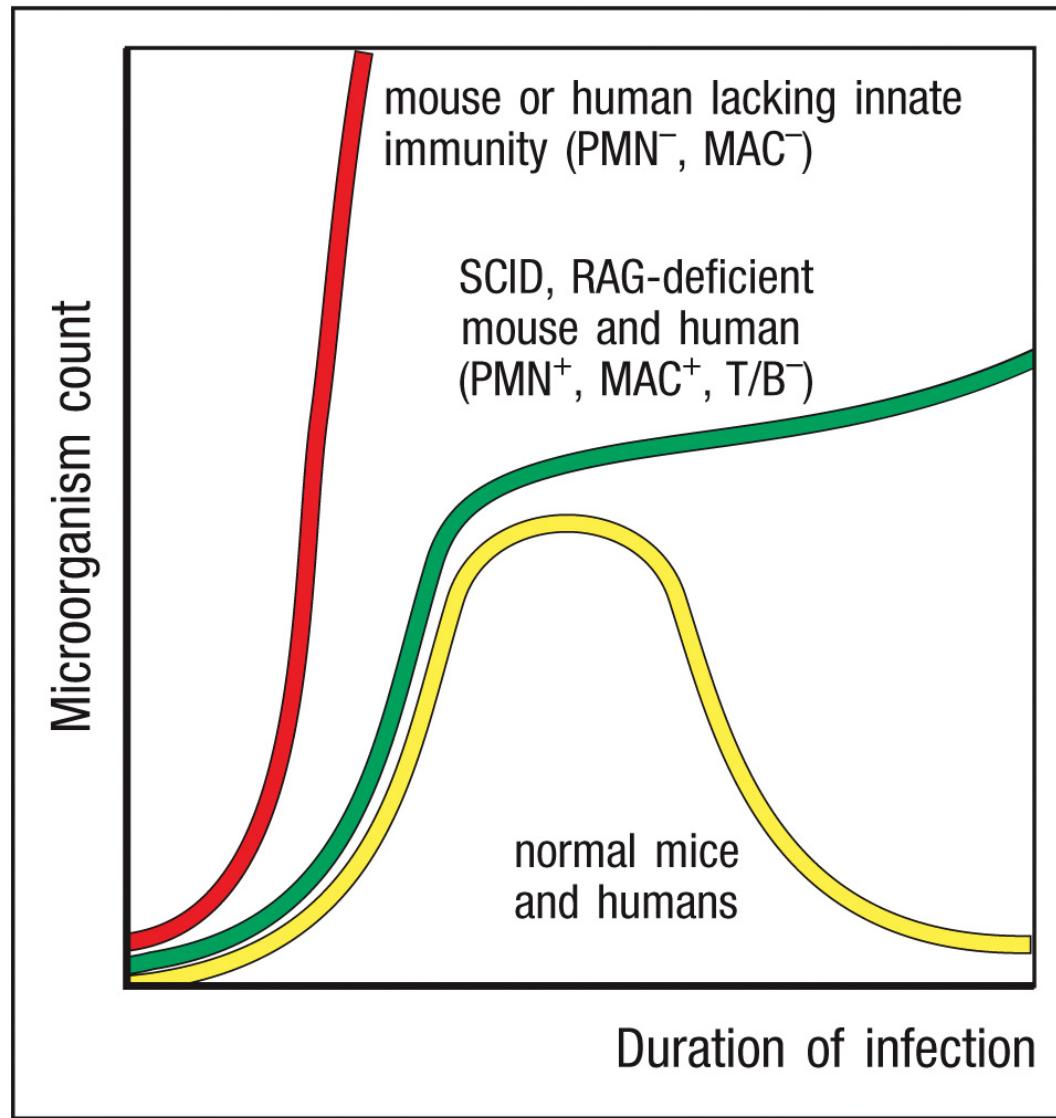

Inflammation

- **Commensal organisms cause little host damage while pathogens damage host tissues by a variety of mechanisms**
- **A.True/B.False:** Our immune system efficiently kills all categories of microbes that attempt to colonize our bodies.

Course of Acute Infection

Consequences of Immunodeficiency

Outline

Course of the immune response

- Pathogen entry point
- First encounter w/ immune system:
local infection & inflammation
- Full activation of immune response:
peripheral lymphoid organs
- Immunological memory

Pathogen Entry Points

Barriers: The First Line of Defense

	Skin	Gut	Lungs	Eyes/nose/oral cavity	
Stratified epithelium	Single cell layer of columnar epithelium	Upper airway: pseudostratified columnar epithelium Lower airway: single cell layer of columnar epithelium	Pseudostratified columnar epithelium		
Mechanical	Epithelial cells joined by tight junctions				
Chemical	Fatty acids	Longitudinal flow of air or fluid	Longitudinal flow of air or fluid	Movement of mucus by cilia	Tears Nasal cilia
		Low pH	Pulmonary surfactant	Enzymes in tears and saliva (lysozyme)	
	β-defensins Lamellar bodies Cathelicidin	α-defensins (cryptdins) RegIII (lecticidins) Cathelicidin	α-defensins Cathelicidin	Histatins β-defensins	
Microbiological	Normal microbiota				

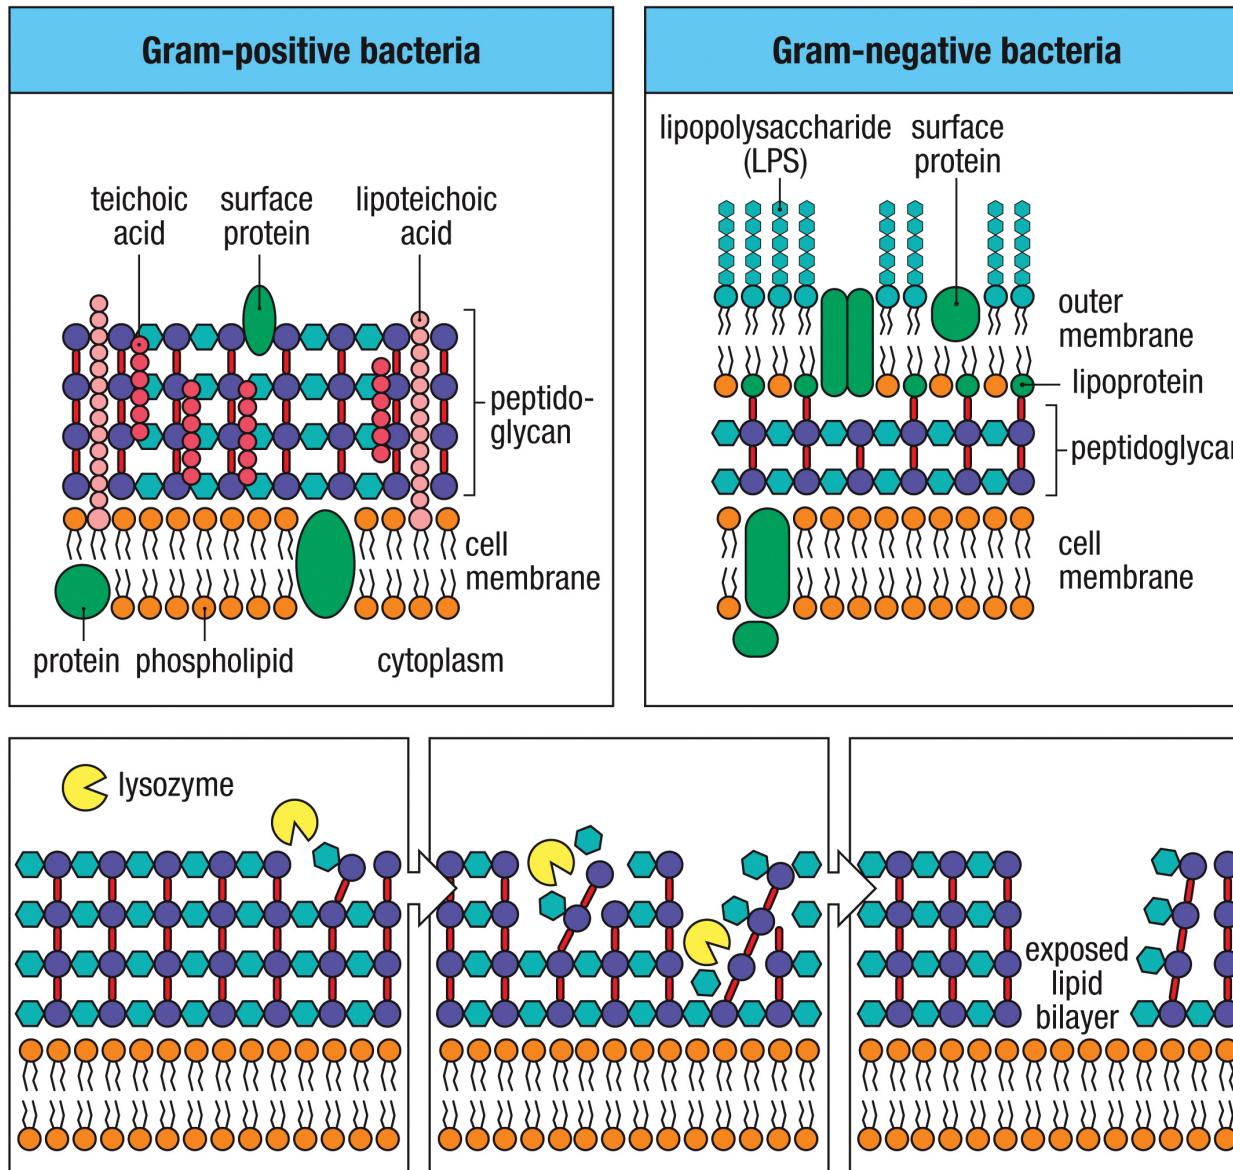

Defensin- Amphipathic Peptides

Specificity of Defensins

Lysozyme

Microbiota

**DEADLY DIARRHEA:
C. DIFFICILE CAUSES IMMENSE SUFFERING, DEATH**

G253604

IMPACT

<td>500,000 Caused close to half a million illnesses in one year.</td> <td><td>Comes back at least once in about 1 in 5 patients who get <i>C. difficile</i>.</td><td><td>Caused 15,000 deaths in one year 1 in 11 people 65 and older died within a month of <i>C. difficile</i> infection diagnosis.</td></td></td>	500,000 Caused close to half a million illnesses in one year.	<td>Comes back at least once in about 1 in 5 patients who get <i>C. difficile</i>.</td> <td><td>Caused 15,000 deaths in one year 1 in 11 people 65 and older died within a month of <i>C. difficile</i> infection diagnosis.</td></td>	Comes back at least once in about 1 in 5 patients who get <i>C. difficile</i> .	<td>Caused 15,000 deaths in one year 1 in 11 people 65 and older died within a month of <i>C. difficile</i> infection diagnosis.</td>	Caused 15,000 deaths in one year 1 in 11 people 65 and older died within a month of <i>C. difficile</i> infection diagnosis.
---	--	--	---	---	---

RISK

<td>People on antibiotics are 7-10 times more likely to get <i>C. difficile</i> while on the drugs and during the month after.</td> <td><td>Being in healthcare settings, especially hospitals or nursing homes.</td><td><td>More than 80% of <i>C. difficile</i> deaths occurred in people 65 and older.</td></td></td>	People on antibiotics are 7-10 times more likely to get <i>C. difficile</i> while on the drugs and during the month after.	<td>Being in healthcare settings, especially hospitals or nursing homes.</td> <td><td>More than 80% of <i>C. difficile</i> deaths occurred in people 65 and older.</td></td>	Being in healthcare settings, especially hospitals or nursing homes.	<td>More than 80% of <i>C. difficile</i> deaths occurred in people 65 and older.</td>	More than 80% of <i>C. difficile</i> deaths occurred in people 65 and older.
--	--	--	--	---	--

SPREAD

<td>Touching unclean surfaces, especially those in healthcare settings, contaminated with feces from an infected person.</td> <td><td>Dirty hands.</td><td><td>Failing to notify other healthcare facilities when patients with <i>C. difficile</i> transfer from one facility to another.</td></td></td>	Touching unclean surfaces, especially those in healthcare settings, contaminated with feces from an infected person.	<td>Dirty hands.</td> <td><td>Failing to notify other healthcare facilities when patients with <i>C. difficile</i> transfer from one facility to another.</td></td>	Dirty hands.	<td>Failing to notify other healthcare facilities when patients with <i>C. difficile</i> transfer from one facility to another.</td>	Failing to notify other healthcare facilities when patients with <i>C. difficile</i> transfer from one facility to another.
---	--	---	--------------	--	---

PREVENT

<td>Improve prescribing of antibiotics.</td> <td><td>Use best tests for accurate results to prevent spread.</td><td><td>Rapidly identify and isolate patients with <i>C. difficile</i>.</td><td><td>Wear gloves and gowns when treating patient with <i>C. difficile</i>. Remember that hand sanitizer doesn't kill <i>C. difficile</i>.</td><td><td>Clean room surfaces with EPA-approved, spore-killing disinfectant (such as bleach), where <i>C. difficile</i> patients are treated.</td></td></td></td></td>	Improve prescribing of antibiotics.	<td>Use best tests for accurate results to prevent spread.</td> <td><td>Rapidly identify and isolate patients with <i>C. difficile</i>.</td><td><td>Wear gloves and gowns when treating patient with <i>C. difficile</i>. Question

- What are the three barriers that a pathogen has to cross to establish an infection?

Outline

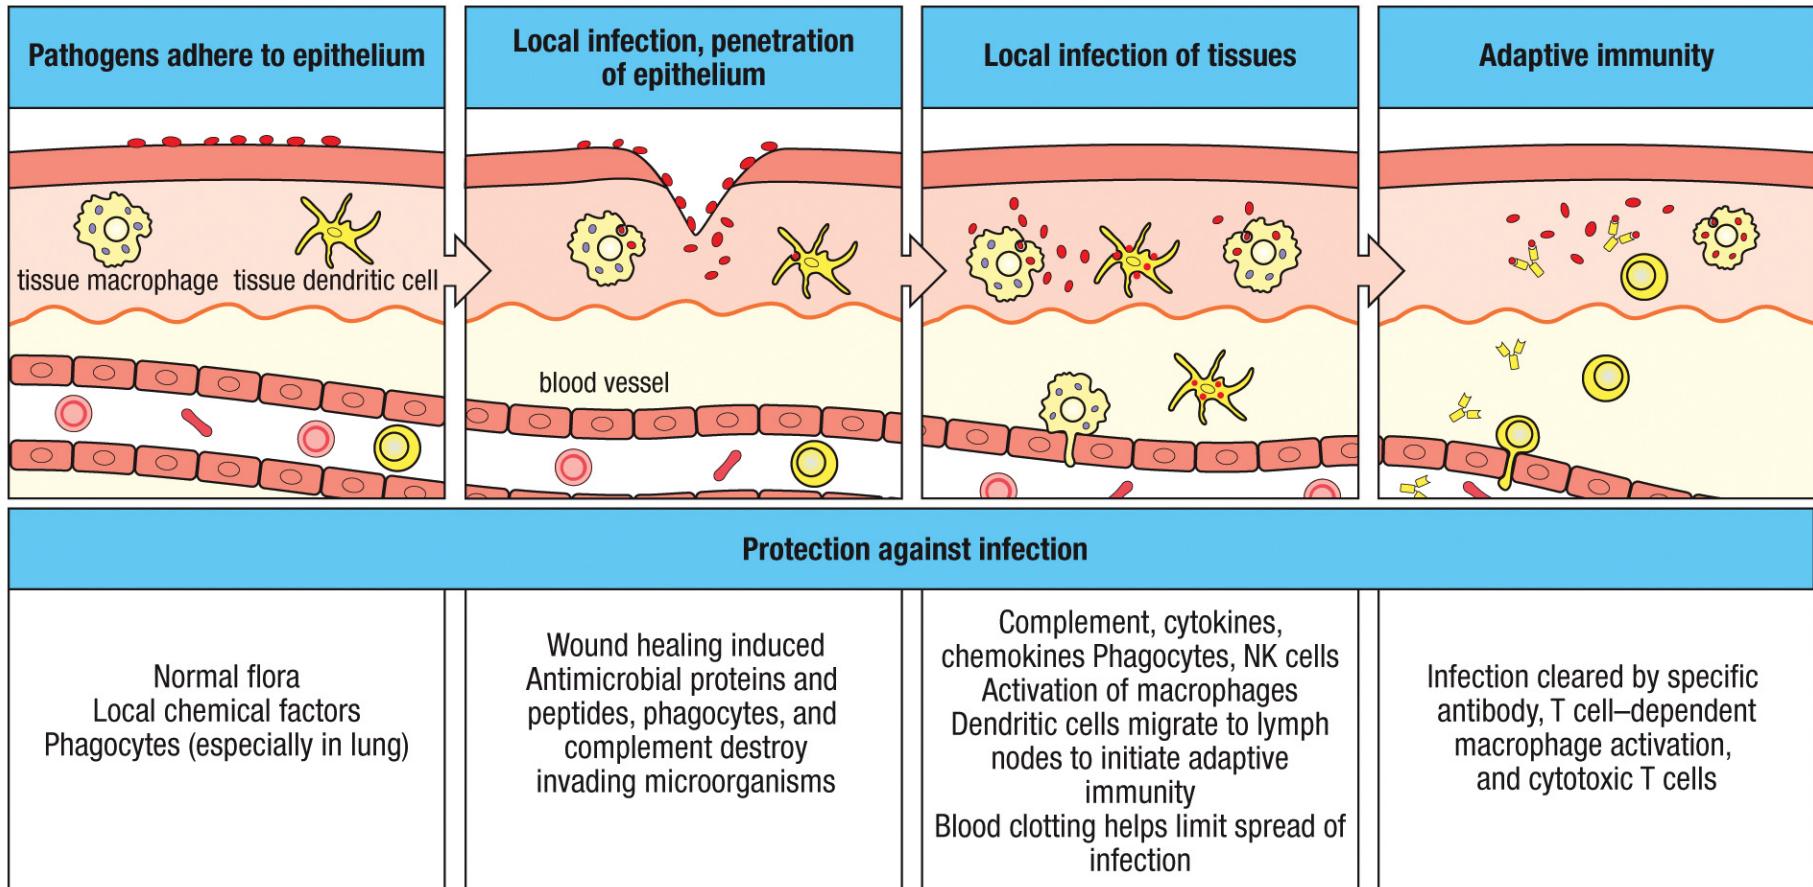

Course of the immune response

- Pathogen entry point
- First encounter w/ immune system:
local infection & inflammation
- Full activation of immune response:
peripheral lymphoid organs
- Immunological memory

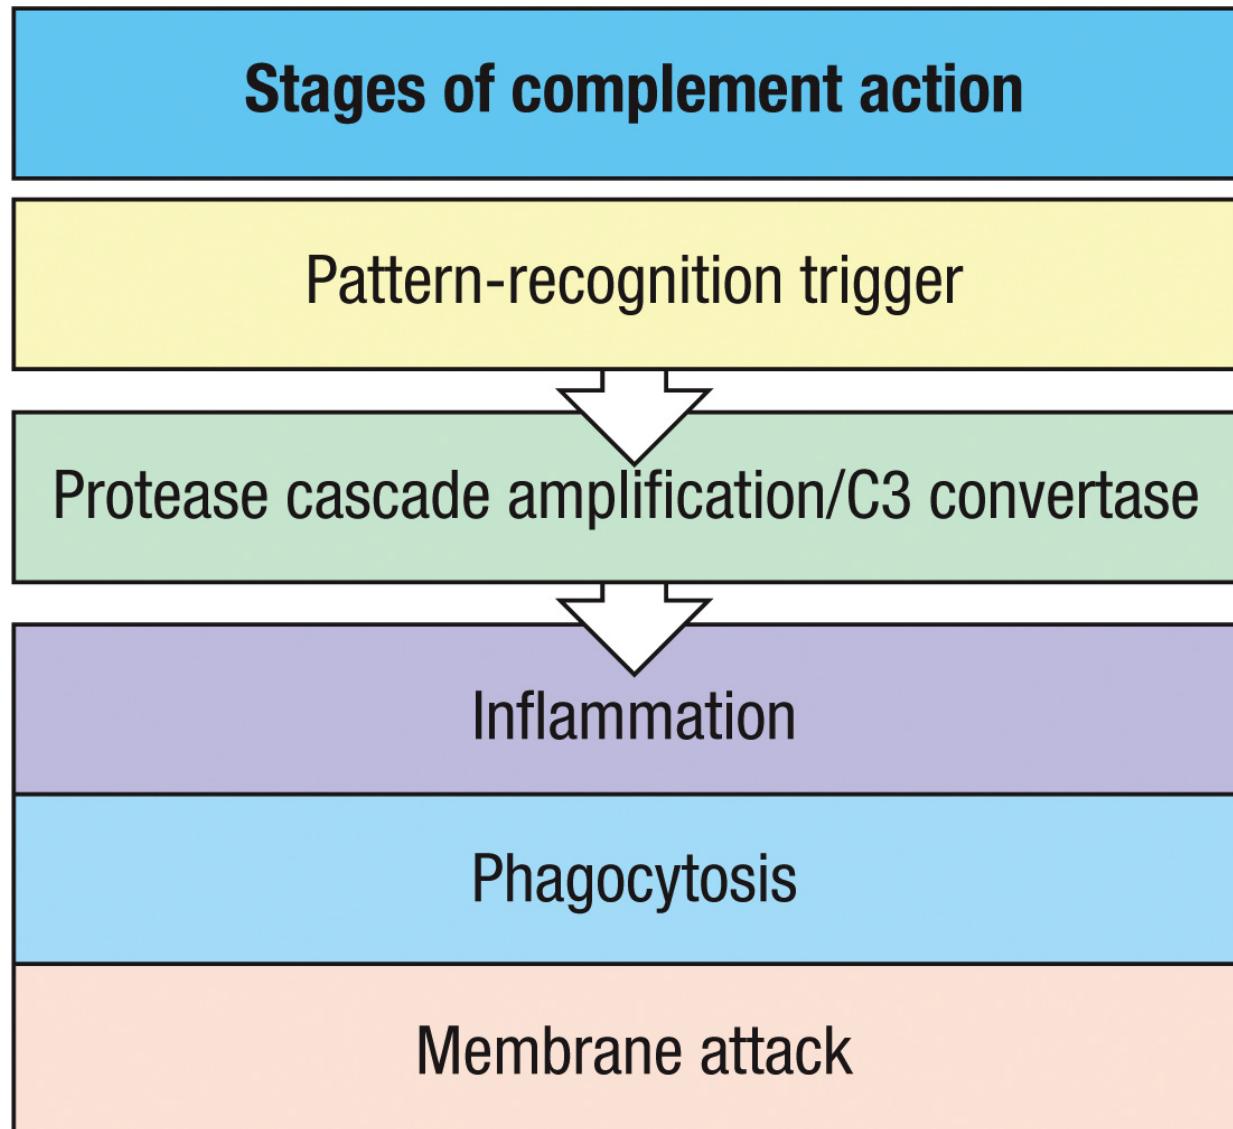

Inflammation Greek Style

Series of Immune Activation

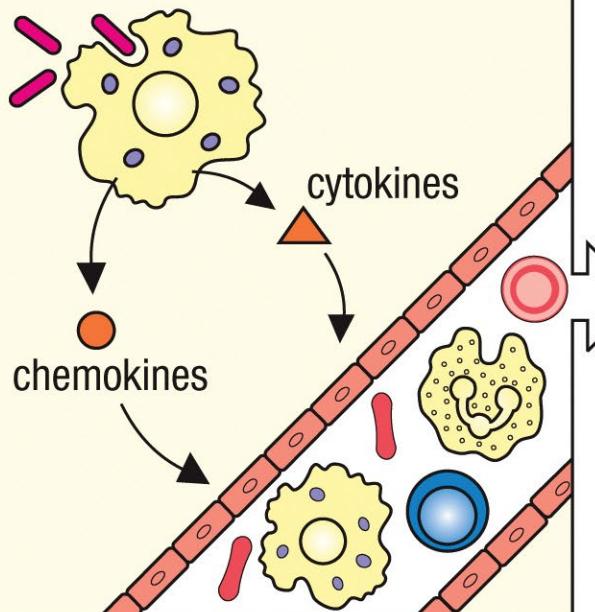

Humoral Innate Immunity: Complement System

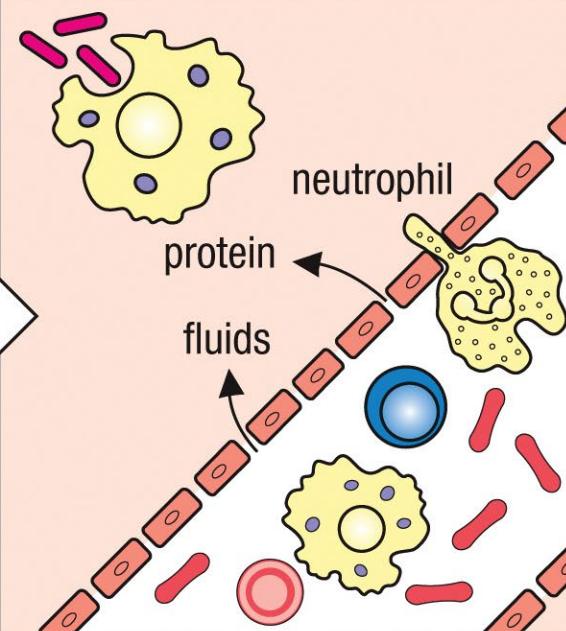

Cytokines and Innate Immune Cells

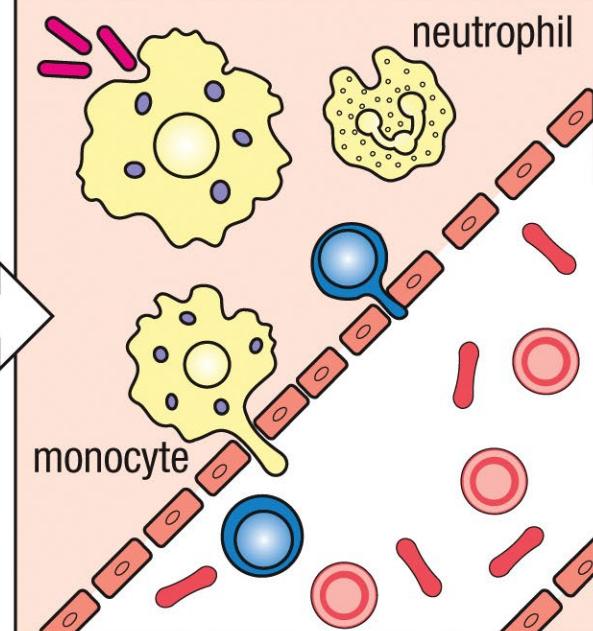

Bacteria trigger macrophages to release cytokines and chemokines

Vasodilation and increased vascular permeability cause redness, heat, and swelling

Inflammatory cells migrate into tissue, releasing inflammatory mediators that cause pain

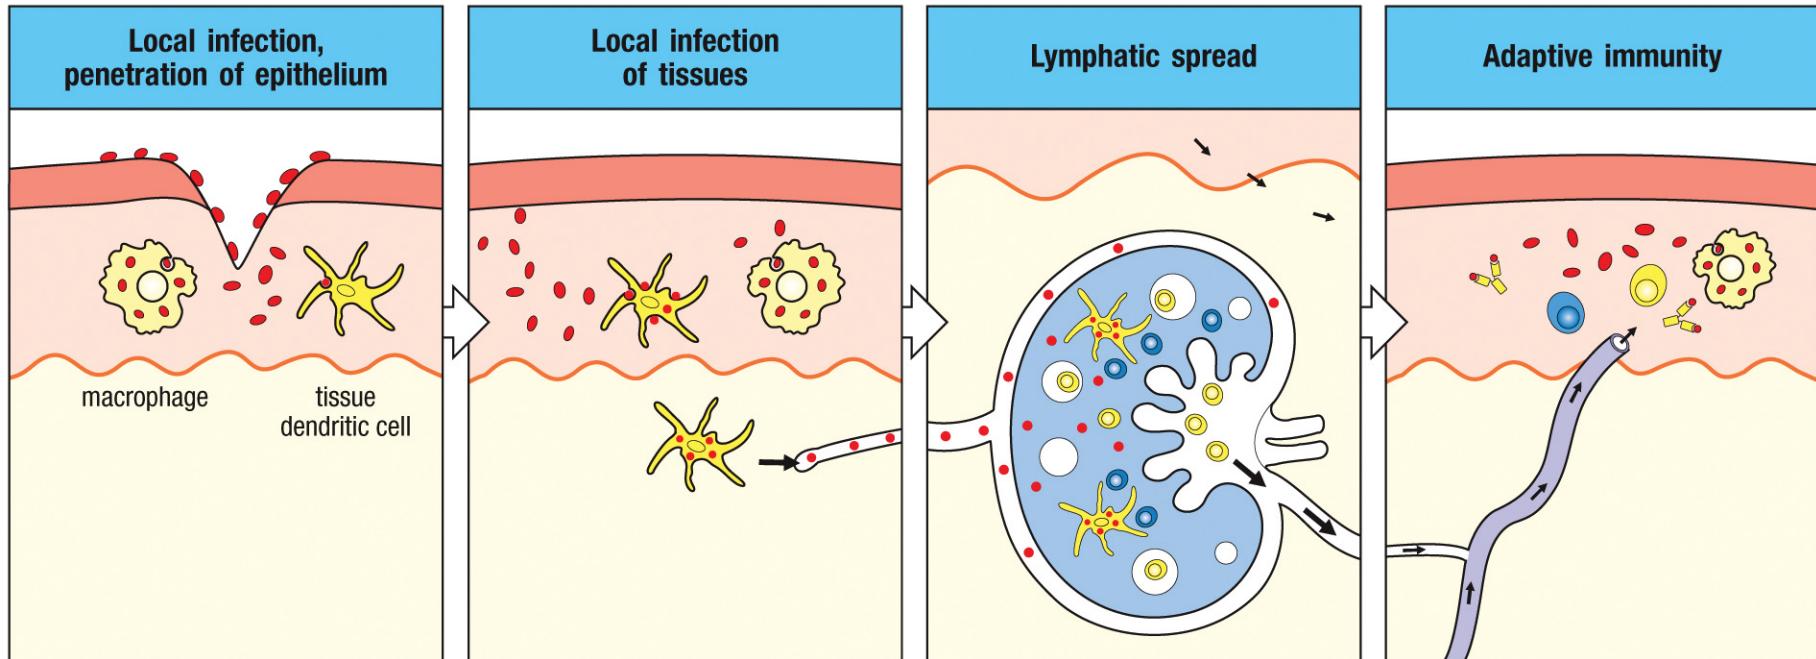

Outline

Course of the immune response

- Pathogen entry point
- First encounter w/ immune system:
local infection & inflammation
- Full activation of immune response:
peripheral lymphoid organs
- Immunological memory

Activation of the Immune Response

Protection against infection

Wound healing induced
Antimicrobial proteins and peptides,
phagocytes, and complement destroy
invading microorganisms

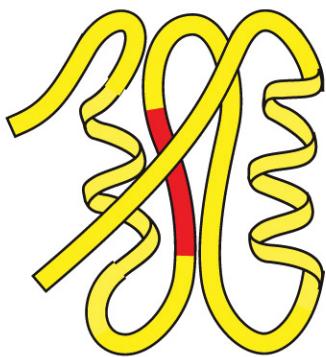

Complement activation
Dendritic cells migrate to lymph nodes
Phagocyte action
NK cells activated
Cytokines and chemokines produced

Pathogens trapped and/or
phagocytosed in lymphoid tissue
Adaptive immunity initiated
by migrating dendritic cells

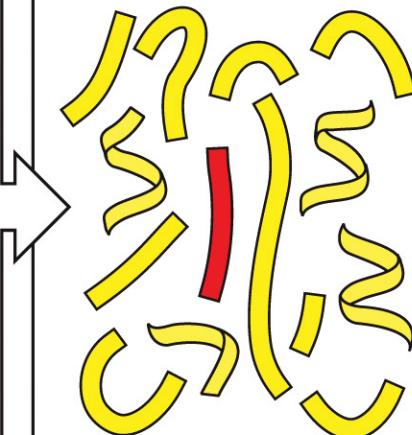

Infection cleared by specific antibody,
T cell-dependent macrophage
activation and/or cytotoxic T cells

Antigen Recognition by TCR

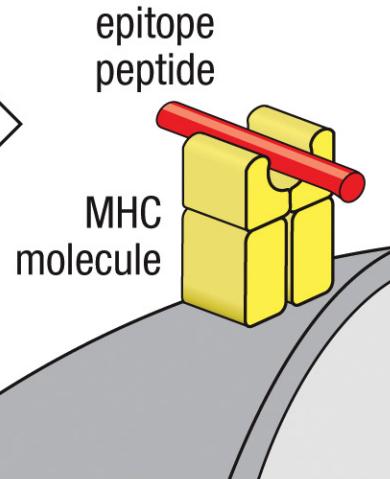

The epitopes recognized by T-cell receptors are often buried

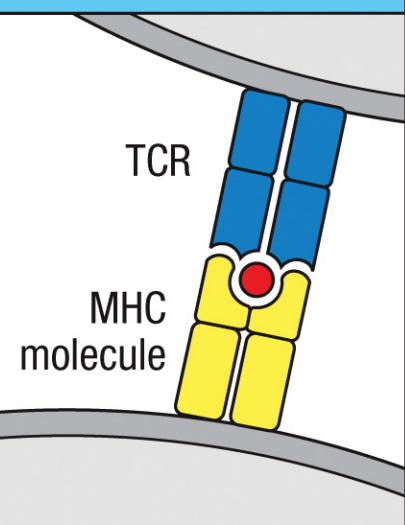

The antigen must first be broken down into peptide fragments

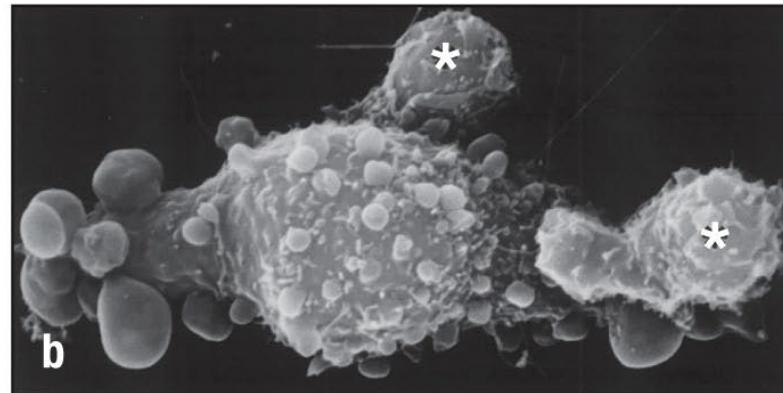

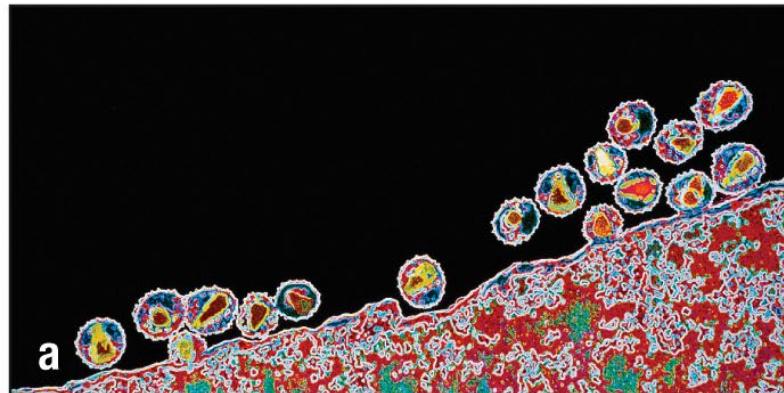

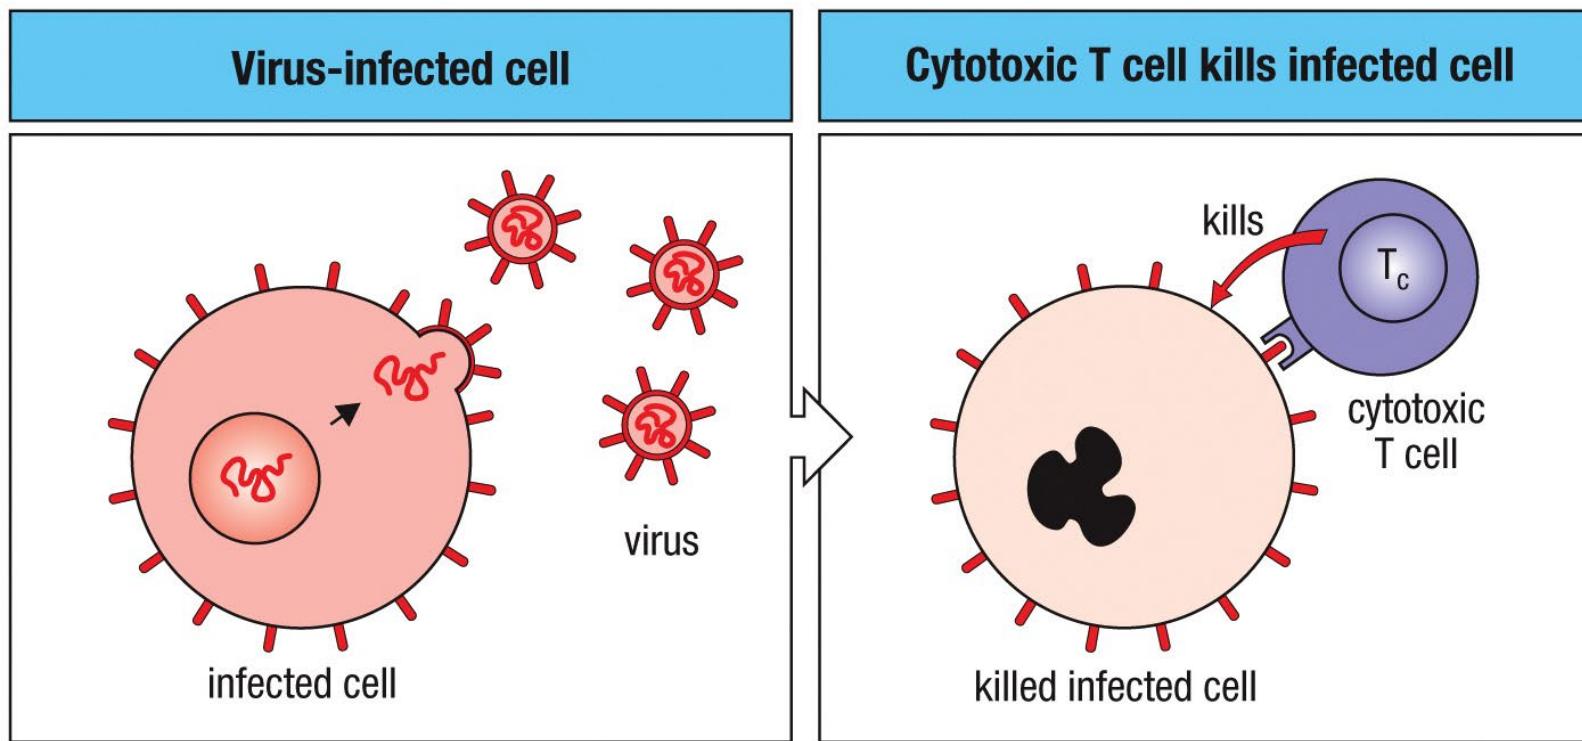

The epitope peptide binds to a self molecule, an MHC molecule

The T-cell receptor binds to a complex of MHC molecule and epitope peptide

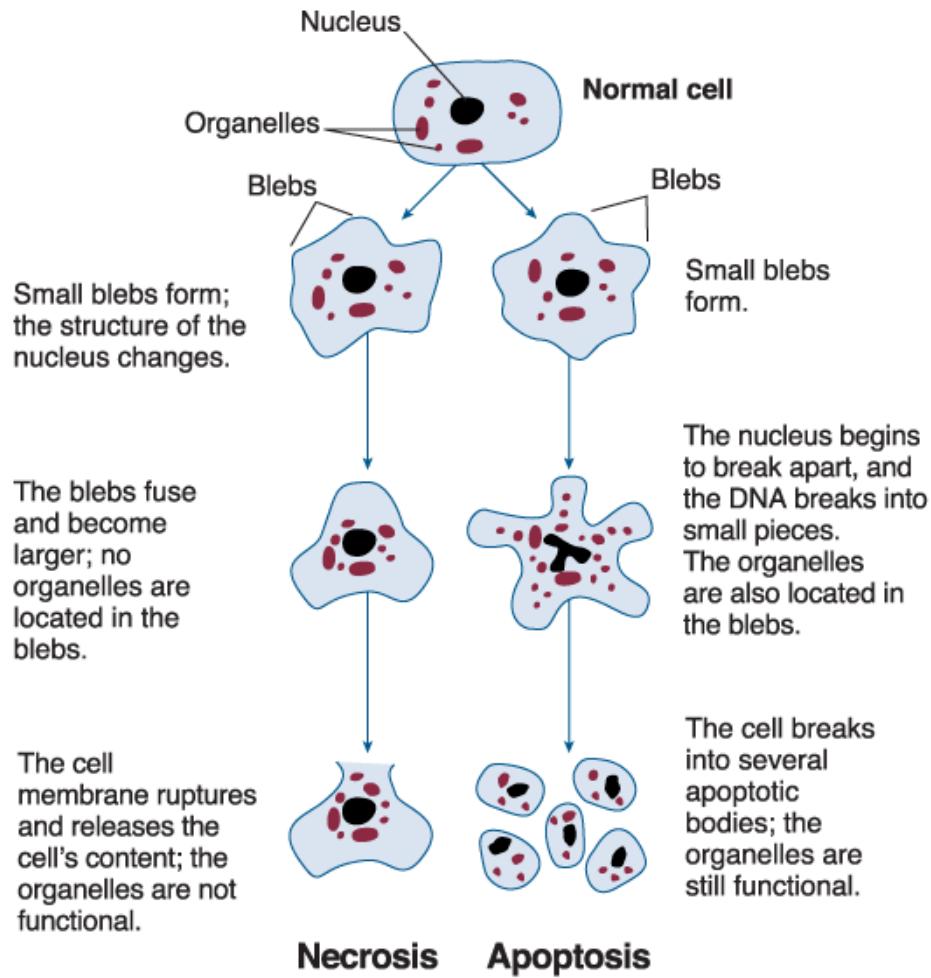

Cytotoxic T Cells Interact With MHC Class I

Mitochondrial Pathway

Helper T Cells Interact With MHC Class II

Humoral Mechanism of Clearing Infection

Specific Defenses Against Specific Pathogens

Site of infection	Extracellular		Intracellular	
	Interstitial spaces, blood, lymph	Epithelial surfaces	Cytoplasmic	Vesicular
Organisms	Viruses Bacteria Protozoa Fungi Worms	<i>Neisseria gonorrhoeae</i> <i>Streptococcus pneumoniae</i> <i>Vibrio cholerae</i> <i>Helicobacter pylori</i> <i>Candida albicans</i> Worms	Viruses <i>Chlamydia</i> spp. <i>Rickettsia</i> spp. Protozoa	<i>Mycobacterium</i> spp. <i>Yersinia pestis</i> <i>Legionella pneumophila</i> <i>Cryptococcus neoformans</i> <i>Leishmania</i> spp.
Protective immunity	Complement Phagocytosis Antibodies	Antimicrobial peptides Antibodies, especially IgA	NK cells Cytotoxic T cells	T cell–dependent and NK cell–dependent macrophage activation

Specific Defenses Against Specific Pathogens

Phases of the immune response			
	Innate phase (Immediate: 0–4 hours)	Induced innate phase (Early: 4–96 hours)	Adaptive immune phase (Late: >96 hours)
	Nonspecific Innate No memory No specific T cells	Nonspecific + specific Inducible No memory No specific T cells	Specific Inducible Memory Specific T cells
Barrier functions	Skin, epithelia, mucins, acid	Local inflammation (C5a) Local TNF- α	IgA antibody in luminal spaces IgE antibody on mast cells Local inflammation
Response to extracellular pathogens	Phagocytes Alternative and MBL complement pathway Lysozyme Lactoferrin Peroxidase Defensins	Mannose-binding lectin C-reactive protein T-independent B-cell antibody Complement	IgG antibody and Fc receptor-bearing cells IgG, IgM antibody + classical complement pathway
Response to intracellular bacteria	Macrophages	Activated NK-dependent macrophage activation IL-1, IL-6, TNF- α , IL-12	T-cell activation of macrophages by IFN- γ
Response to virus-infected cells	Natural killer (NK) cells	IFN- α and IFN- β IL-12-activated NK cells	Cytotoxic T cells IFN- γ

Question

Who fights who?

- A. Cytotoxic T cells
- B. Antibodies
- C. T helper cells
- D. Complement

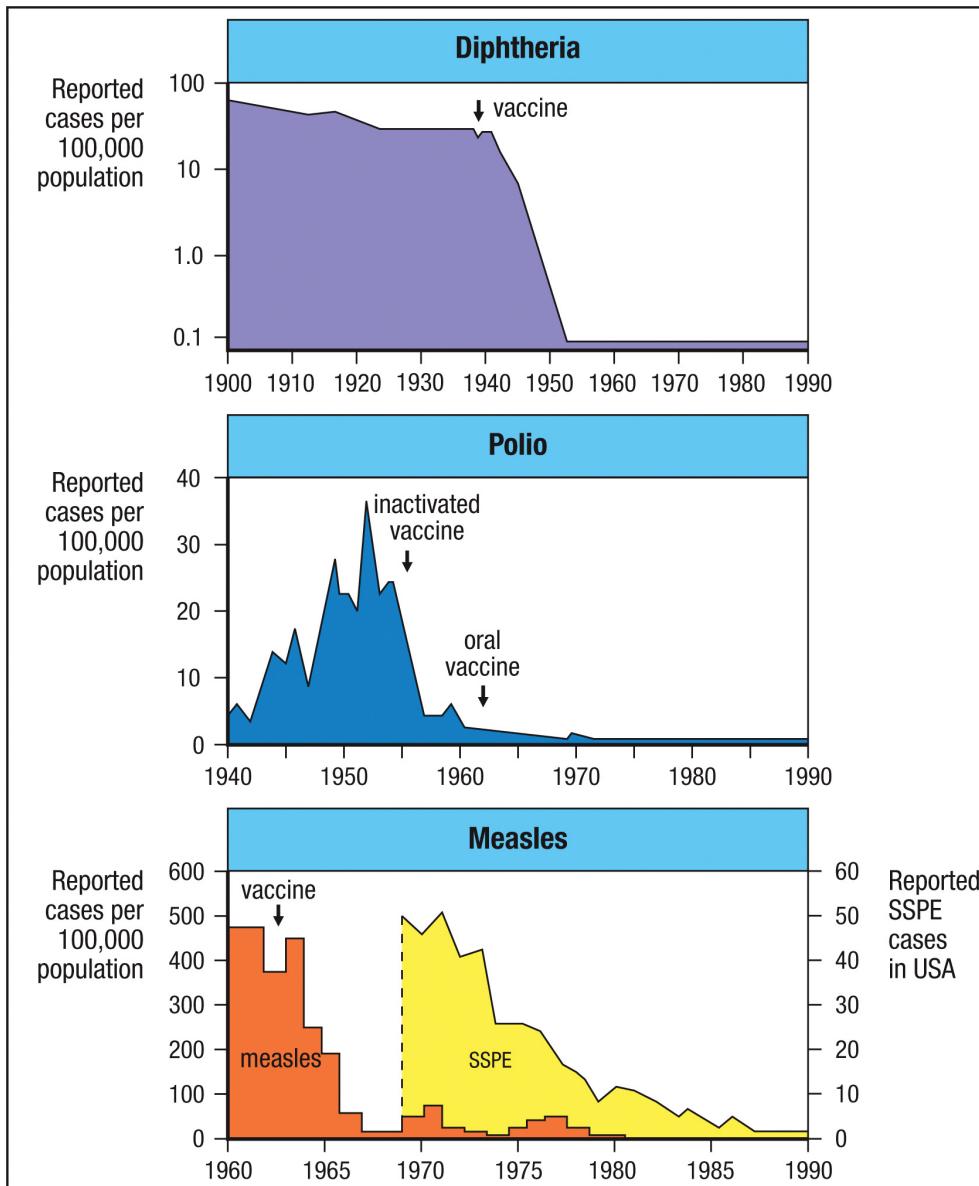

- 1. Virus
- 2. Intracellular bacteria in cytosol
- 3. Intracellular bacteria in phagosome
- 4. parasites

Outline

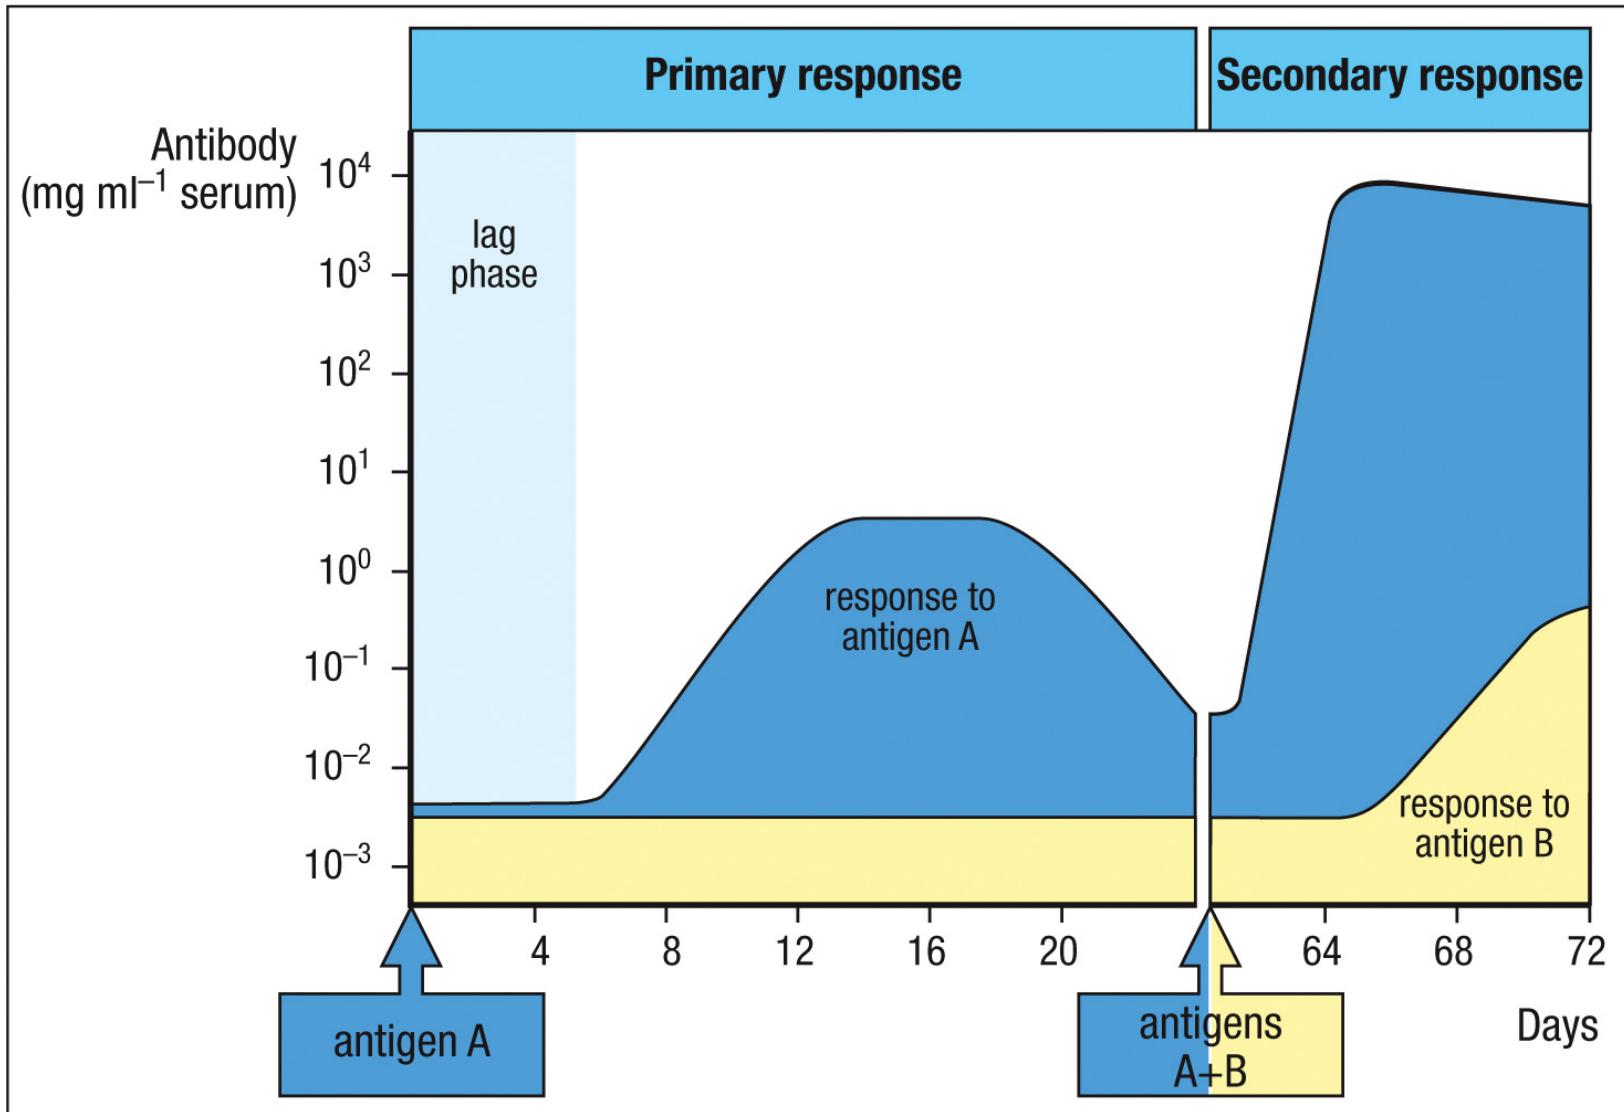

Course of the immune response

- Pathogen entry point
- First encounter w/ immune system:
local infection & inflammation
- Full activation of immune response:
peripheral lymphoid organs
- Immunological memory

Vaccination is the most effective means of controlling infectious diseases

Course of Immunization

Course of Smallpox Vaccination

After smallpox vaccination, antibody levels show no significant decline, and T-cell memory shows a half-life of 8–15 years
